Presenting a thorough introduction to biodiversity in decaying wood, the book studies the rich diversity of fungi, insects and vertebrates that depend upon dead wood.

Biodiversity in Dead Wood Fossils document the existence of trees and wood-associated organisms from almost 400 million years ago, and today there are between 400 000 and 1 million wood-inhabiting species in the world. This is the first book to synthesize the natural history and conservation needs of wood-inhabiting organisms.

The importance of dead wood for biodiversity is widely recognized but strategies for conservation exist only in some regions worldwide. Most strategies combine knowledge from observational and experimental studies

Dead wood is playing a complex role in forest ecosystems: from reducing erosion and maintaining slope and soil surface stability, to biodiversity conservation, forest regeneration (seedbed for plants) and carbon storage.

### **DEAD WOOD AN IMPORTANT ISSUE FOR FOREST BIODIVERSITY**

One of the primary reasons to manage dead wood is to maintain biodiversity in forests. Saprophytic species

are one of the most threatened types of organisms due to declining forest areas and lack of dead wood (Stokland et al. 2012).

However, considering that wood-inhabiting fungi represent a large proportion of saproxylic biodiversity and are the main decomposers of wood (Boddy et al., 2008, Stokland et al., 2012), they are underrepresented in experimental studies of dead wood, especially in the tropics and subtropics.

Dead wood is a critical resource for forest biodiversity and widely used as an indicator for sustainable forest management. Based on data from the Swedish National Forest Inventory we provide baseline information and analyze trends in volume and distribution of dead wood in Swedish managed forests during 15 years.
